Chemistry 11

Unit 2: Introduction to Chemistry

Book 2: Unit Conversions & Scientific Notation

KEY Name:

Block:

imension Analysis" rev Sico factor is a fraction or factor written so that Unit Converstions the denominator and numerator are equivalent values with different units. One of the most useful conversion factors allows the user to convert from the _____ the mperial system and vice versa. Since 1 inch is exactly the same length as 2.54 cm, the factor may be expressed as: 1 inch 5 = These two lengths are identical so multiplication of a given length by the conversion factor will not change the length. It will simply express it in a different unit. Now if you wish to determine how many centimetres are in a ard, you have two things to consider. lyd. First, which of the two forms of the conversion factor will allow you to ______ the imperial unit, converting it to a metric unit? Second, what other conversion factors will you need to complete the task? Assuming you know, or can access, these equivalencies: 1 yard = <u></u>feet 1 foot = 1 and inches 0 cm 1 2 3 <u>ach would be as follows:</u> 12:1 0 in 1cm Notice that as with the multiplication of any fractions, it is possible to <u>CONCLA</u> <u>any Ming that a plears</u> on the top AND bottom Figure 1.4.2 A ruler with both We've simply followed a numerator-to-denominator pattern to convert yards to feet to imperial and metric scales inches to cm. shows that 1 inch = 2.54 cm. The number of feet in a yard and inches in a foot are values. They are not things we measured. Thus they <u>DO</u> <u>NOT</u> affect the number of significant figures in our answer. This will be the case for any ______ CONVERSION factors_ in which the numerator and denominator are in the same system (both metric or both imperial). As all three of the conversion factors we used are detined value , only the original value of 1.00 yards influences the significant figures in our answer. Hence we round the answer to three sig figs. the TOP part 1 min Example: How many minutes are there in 3480 seconds? EQUALS 60 s the BOTTOM part osite inits cancel. Both 60 s and 1 min are the same length of time. "Equal to", this is the converstion factor. Multiplying by the converstion facor did not change the VALUE fo the time. However, the units are different after using the conversion factor: we started with a LARGE number of small units and ended up with a small number of LARGE units. 2

The method of unit conversions uses **conversion factors** to change the units associated with an expression to a different set of units.

Every unit conversion problem has three major pieces of information which must be identified:

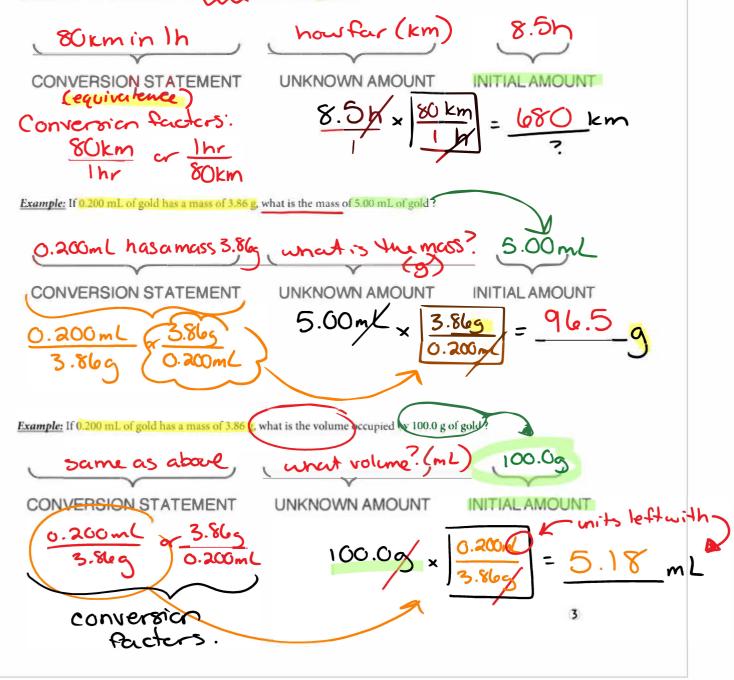

- i) the unknown amount and its units
- ii) the initial amount and its units
- iii) a conversion factor which relates (connects) the initial units to the units of the unknown

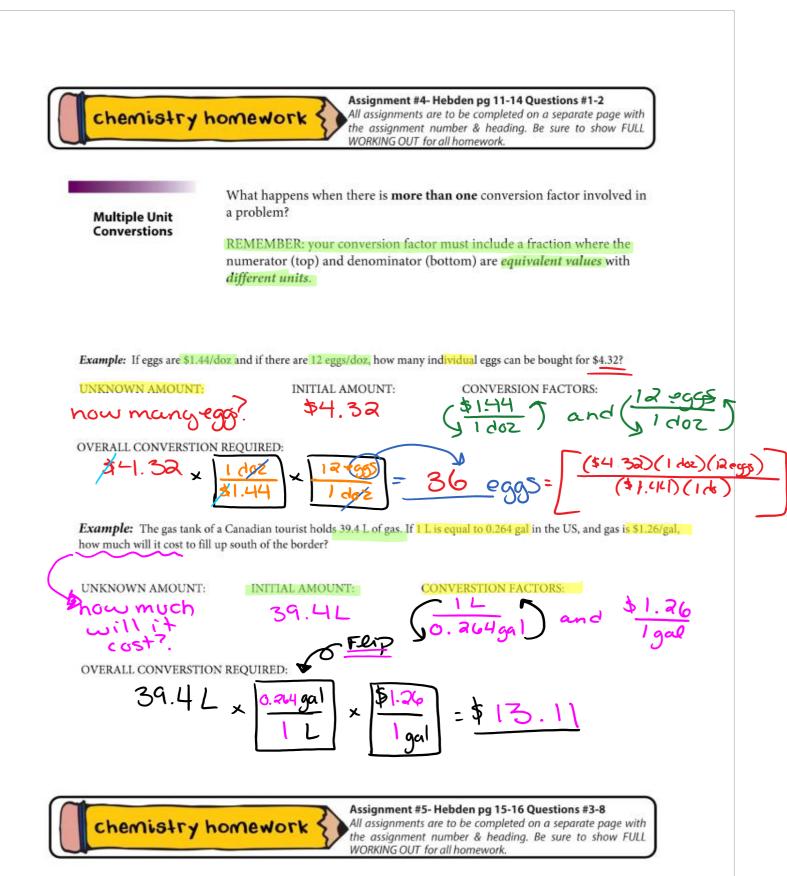

INCREDIBLY, VITALLY IMPORTANT NOTE!

In all the calculations which follow you must ALWAYS include the units, for they are the "major players" in the calculation. If you are tempted to omit or "forget about" the units, DON'T! The course you fail could be Chem 11!

Example: If a car can go 80 km in 1 h, how far can the car go in 8.5 h?

Converting Within the Metric System

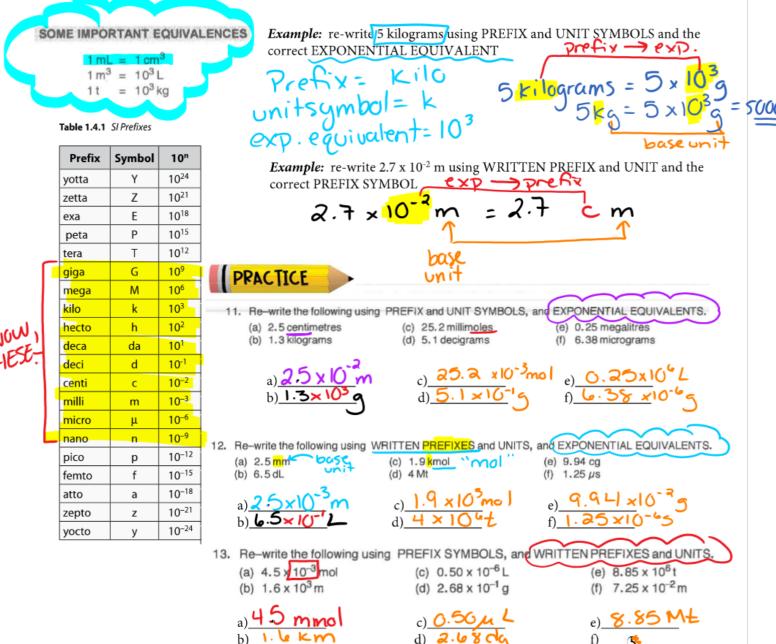

Measures	Unit Name	Symbol
length	metre	m
mass	gram	g
volume	litre	L
time	second	s

The metric system is based on powers of ______ prefixes. You will need to memorize from "nano" 10⁻⁹ to "giga" 10⁹.

You should highlight these.

Metric conversions require either one or two steps. You will recognize a one-step metric conversion by the presence of a **DOSE UNIT** in the question.

The common base units in the metric system include: m, g, L and s.

c) 0.50 m d) **2.6 8 c**

	One step metric conversions involve a base unit (metres, litres, grams,
ne & Two-Step	or seconds) being converted to a $\underline{Pre} + \underline{X} \times \underline{n} + \underline{I}$ or a prefixed unit being converted to
Converstions	
	a base unit. $eg. \longrightarrow \mu m \propto m \longrightarrow m$
Metric conversi	ons involve using unit conversions between prefix symbols and exponential equivalents.
EXAMPLES:	(a) Write a conversion statement between cm and m.
	Since "c" stands for " 10^{-2} " then $1 \text{ cm} = 10^{-2} \text{ m}$. (b) Write a conversion statement between ms and s .
	Since "m" stands for " 10^{-3} " then $1 \text{ ms} = 10^{-3} \text{ s}$.
Sample Proble	ns — One-Step Metric Conversions
1. Convert 9.4 nm i	10 ⁻⁵ 5 1m ⁵

Multiplication and Division in Scientific Notation

To Mul hely two numbers in scientific notation, we multiply the decimal #5 and state their product multiplied by 10, raised to a power that is the SUM of the exponents

 $(A \times 10^{a}) \times (B \times 10^{b}) = (A \times B) \times 10^{(a+b)}$

To *divide* two numbers in scientific notation, we divide one mantissa by the other and state their quotient multiplied by 10, raised to a power that is the *difference* between the exponents.

PRACTICE — Multiplication and Division Using Scientific Notation

Solve the following problems, expressing the answer in scientific notation, *without* using a calculator. Repeat the questions using a calculator and compare your answers. Compare your method of solving with a calculator with that of another student.

1. $(4 \times 10^{3}) \times (2 \times 10^{4}) = \underbrace{8 \times 10^{7}}_{2. (9.9 \times 10^{5}) \div (3.3 \times 10^{3})} = \underbrace{3 \cdot 0 \times 10^{7}}_{3. (3.1 \times 10^{-4}) \times (6.0 \times 10^{7})]} \div (2.0 \times 10^{5}) = \underbrace{9.3 \times 10^{7}}_{3. \times 10^{-2}} \div (1.5 \times 10^{4})] \times (2.5 \times 10^{-6}) = \underbrace{7.5 \times 10^{-2}}_{3. \times 10^{-2}} \div (3.0 \times 10^{5}) \div (2.5 \times 10^{-6})$

Addition and Subtraction in Scientific Notation

Remember that a number in proper scientific notation will always have a mantissa between ____ and ____ Sometimes it becomes necessary to <u>_____</u>a decimal in order to express a number in proper scientific notation.

The number of places shifted by the decimal is indicated by an equivalent change in the value of the exponent. If the decimal is shifted the sponent becomes the exponent become shifting the decimal to the sponent to become

Another way to remember this is if the *mantissa becomes smaller* following a shift, the *exponent becomes larger*. Consequently, if the *exponent becomes larger*, the *mantissa becomes smaller*. Consider AB.C \times 10^x: if the decimal is shifted to change the value of the mantissa by 10ⁿ times, the value of x changes –n times.

For example,

A number such as $18\,235.0 \times 10^2$ (1 823 500 in standard notation) requires the decimal to be <u>shifted 4</u> places to the <u>ceft</u> to give a mantissa between 1 and 10, that is 1.823 50. A <u>ceft</u> shift places, means the exponent in the ordinate becomes <u>4 numbers</u> larger (from 10^2 to 10^6). The correct way to express $18\,235.0 \times 10^2$ in scientific notation is $1.823\,50 \times 10^6$.

PRACTICE

Express each of the given values in proper scientific notation in the second column. Now write each of the given values from the *first* column in expanded form in the third column. Then write each of your answers from the *second* column in expanded form. How do the expanded answers compare?

	et let	t = larger	"Key Notation		
	Given Value	🔸 Proper Notation 👝	Expanded Form	Expanded Answer	
1.	6.014.51 × 12	6.01451×10	601 451		
2.	0.001.6×107-2	1.6×104	16000		
3.	$38325.3 imes 10^{-6}$	3.83253×10-2	0.0383253		
4.	0.4196×10 ⁻²	4.196×10-3	0.004196		
	> Right = smaller				

When adding or subtracting numbers in scientific notation, it is important to realize that we add or subtract only the mantissa. *Do not add or subtract the exponents!*

decimal part

Steps for Adding + Subtracting in Scientific Notation

- 1) <u>Shift the decimal</u> to obtain the <u>Same number</u> for <u>the exponent</u> in the ordinate of both numbers to be added or subtracted.
- 2) <u>SUME</u> or take the difference of the mantissas. decimal numbers.
- 3) Convert back to proper scientific notation when finished. (I reeded)

Sample Problems — Addition and Subtraction in Scientific Notation

Solve the following problems, expressing the answer in proper scientific notation. 1. $(5.19 \times 10^3) - (3.14 \times 10^2) =$

2. $(2.17 \times 10^{-3}) + (6.40 \times 10^{-5}) =$

What to Think about

Example #1

 Begin by shifting the decimal of one of the numbers and changing the exponent so that both numbers share the *same exponent*.
 For consistency, adjust one of the numbers so that *both* numbers have the *larger* of the two ordinates.

The goal is for both mantissas to be multiplied by 10³. This means the exponent in the second number should be increased by one. Increasing the exponent requires the decimal to shift to the left (so the mantissa becomes smaller).

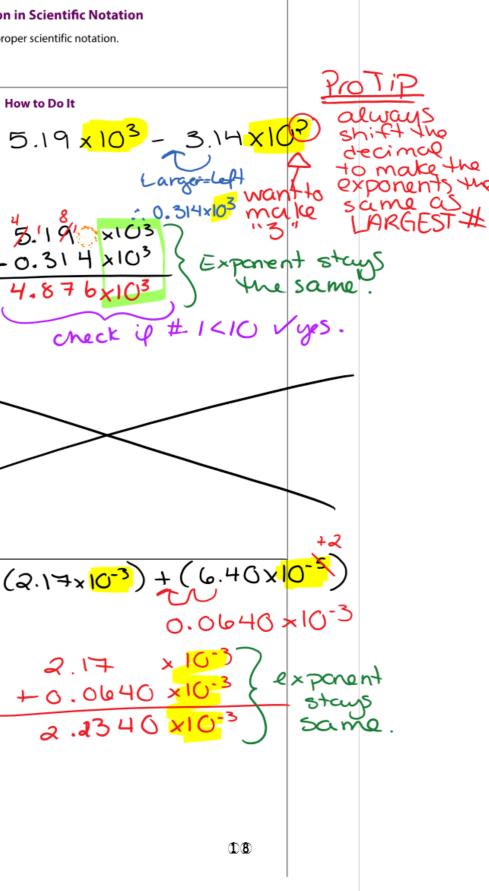

2. Once both ordinates are the same, the mantissas are simply subtracted.

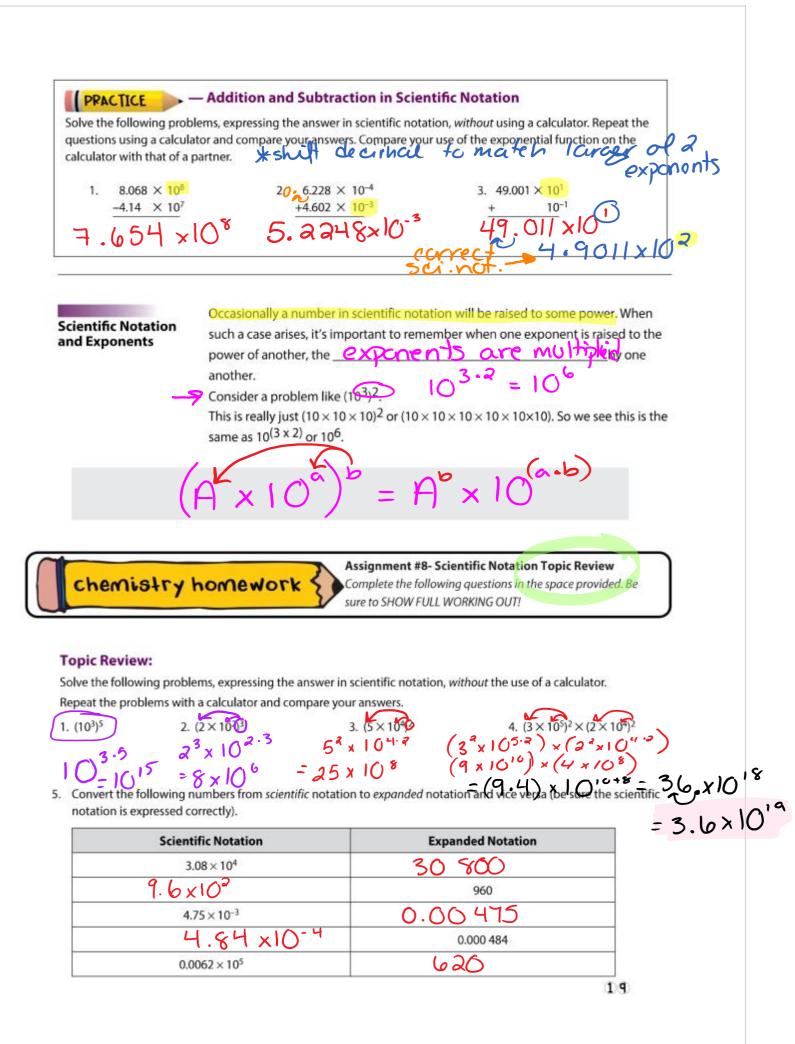

Example #1 — Alternate Approach

- 1. It is interesting to note that we could have altered the first number instead. In that case, 5.19×10^3 would have become 51.9×10^2 .
- In this case, the difference results in a number that is not in proper scientific notation as the mantissa is greater than 10.
- Consequently, a further step is needed to convert the answer back to proper scientific notation. Shifting the decimal one place to the left (mantissa becomes smaller) requires an increase of 1 to the exponent.

Example # 2

- As with differences, begin by shifting the decimal of one of the numbers and changing the exponent so both numbers share the same ordinate. The *larger ordinate* in this case is 10⁻³.
- Increasing the exponent in the second number from -5 to -3 requires the decimal to be shifted two to the left (make the mantissa smaller).
- 3. Once the exponents agree, the mantissas are simply summed.

Give the product or quotient of each of the following problems (express all answers in proper form scientific notation). Do not use a calculator.

(a)
$$(8.0 \times 10^3) \times (1.5 \times 10^6) = [.2 \times 10^{-10})^{-10}$$

(b) $(1.5 \times 10^4) \div (2.0 \times 10^2) = 7.5 \times 10^{-1} (75)$
(c) $(3.5 \times 10^{-2}) \times (6.0 \times 10^5) = 2.1 \times 10^{-4}$
(d) $(2.6 \times 10^7) \div (6.5 \times 10^{-4}) = 4.0 \times 10^{-6}$

 Give the product or quotient of each of the following problems (express all answers in proper form scientific notation). Do **not** use a calculator.

(a) $(3.5 \times 10^4) \times (3.0 \times 10^5) = 1.05 \times 10^{16}$ (b) $(7.0 \times 10^6) \div (1.75 \times 10^2) = 4.0 \times 10^{16}$ (c) $(2.5 \times 10^{-3}) \times (8.5 \times 10^{-5}) = 2.13 \times 10^{-7}$ (d) $(2.6 \times 10^5) \div (6.5 \times 10^{-2}) = 4.0 \times 10^{16}$

Solve the following problems, expressing the answer in scientific notation, without using a calculator. Repeat the
questions using a calculator and compare your answers.

(a)
$$4.034 \times 10^{5}$$
 (b) 3.114×10^{-6} (c) 26.022×10^{2}
 -2.12×10^{4} $+2.301 \times 10^{-5}$ $+7.04 \times 10^{-1}$
 3.802×10^{5} 2.6099×10^{3}

Solve the following problems, expressing the answer in scientific notation, without using a calculator. Repeat the questions using a calculator and compare your answers.

(a)
$$2.115 \times 10^{8}$$
 (b) 9.332×10^{-3}
 (c) 68.166×10^{2}
 -1.11×10^{7}
 $\pm 6.903 \times 10^{-4}$
 $\pm \times 10^{-1}$
 2.00×10^{8}
 $1.00 a a x 10^{-3}$
 $6.1 & 6 & 1x^{10^{-1}}$

 Solve each of the following problems without a calculator. Express your answer in correct form scientific notation. Repeat the questions using a calculator and compare.

(a)
$$(10^{-4})^3$$
 (b) $(4 \times 10^5)^3$ (c) $(7 \times 10^9)^2$ d. $(10^2)^2 \times (2 \times 10)^3$
L O X O $(7 \times 10^9)^2$ d. $(10^2)^2 \times (2 \times 10)^3$
H O X O $(7 \times 10^9)^2$ d. $(10^2)^2 \times (2 \times 10)^3$

11. Solve each of the following problems *without* a calculator. Express your answer in correct form scientific notation. Repeat the questions using a calculator and compare.
(a) (6.4×10⁻⁶ + 2.0×10⁻⁷) ÷ (2×10⁶ + 3.1×10⁷) = 2 ○ × ○ × ○

(b)
$$\frac{3.4 \times 10^{-17} \times 1.5 \times 10^4}{1.5 \times 10^{-4}} = 3.4 \times 10^{-9}$$

(c) $(2 \times 10^3)^3 \times [(6.84 \times 10^3) \div (3.42 \times 10^3)] = 1.6 \times 10^{16}$

(d)
$$\frac{(3 \times 10^2)^3 + (4 \times 10^3)^2}{1 \times 10^4} = 7 \times 10^{23}$$
